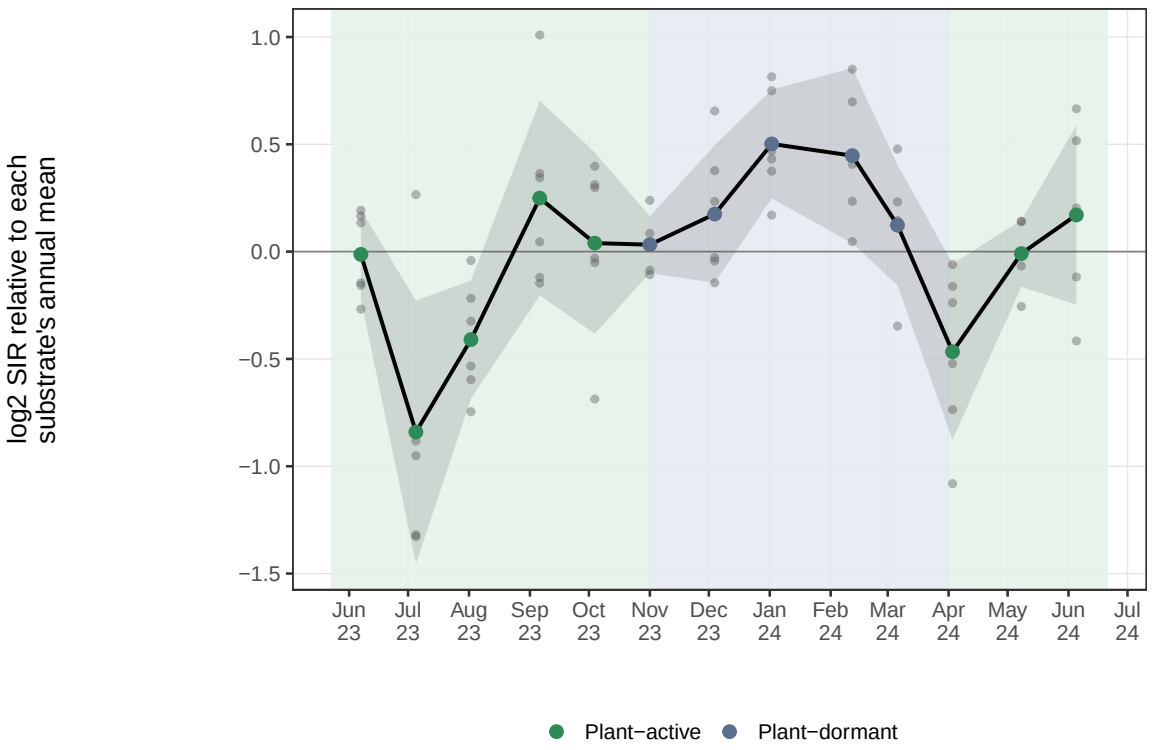
A

Level: SIR averaged over all 31 substrates

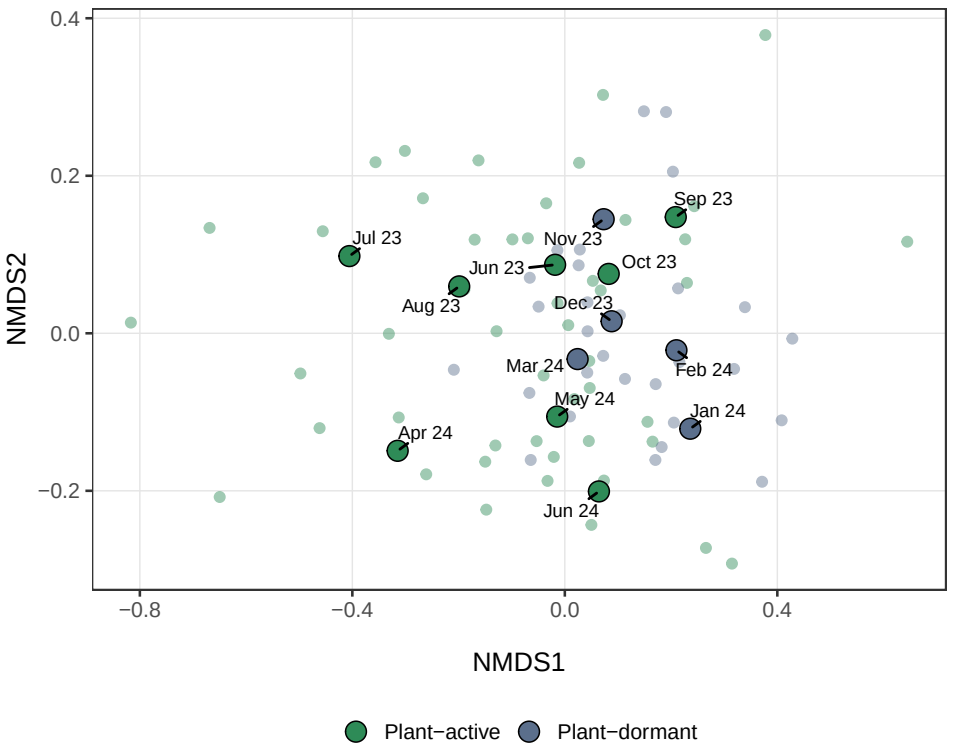
Dormant vs active: +34% (log2 0.42, 95% CI 0.01 to 0.83), p = 0.045



B

Whole profile of 31 substrates (NMDS)

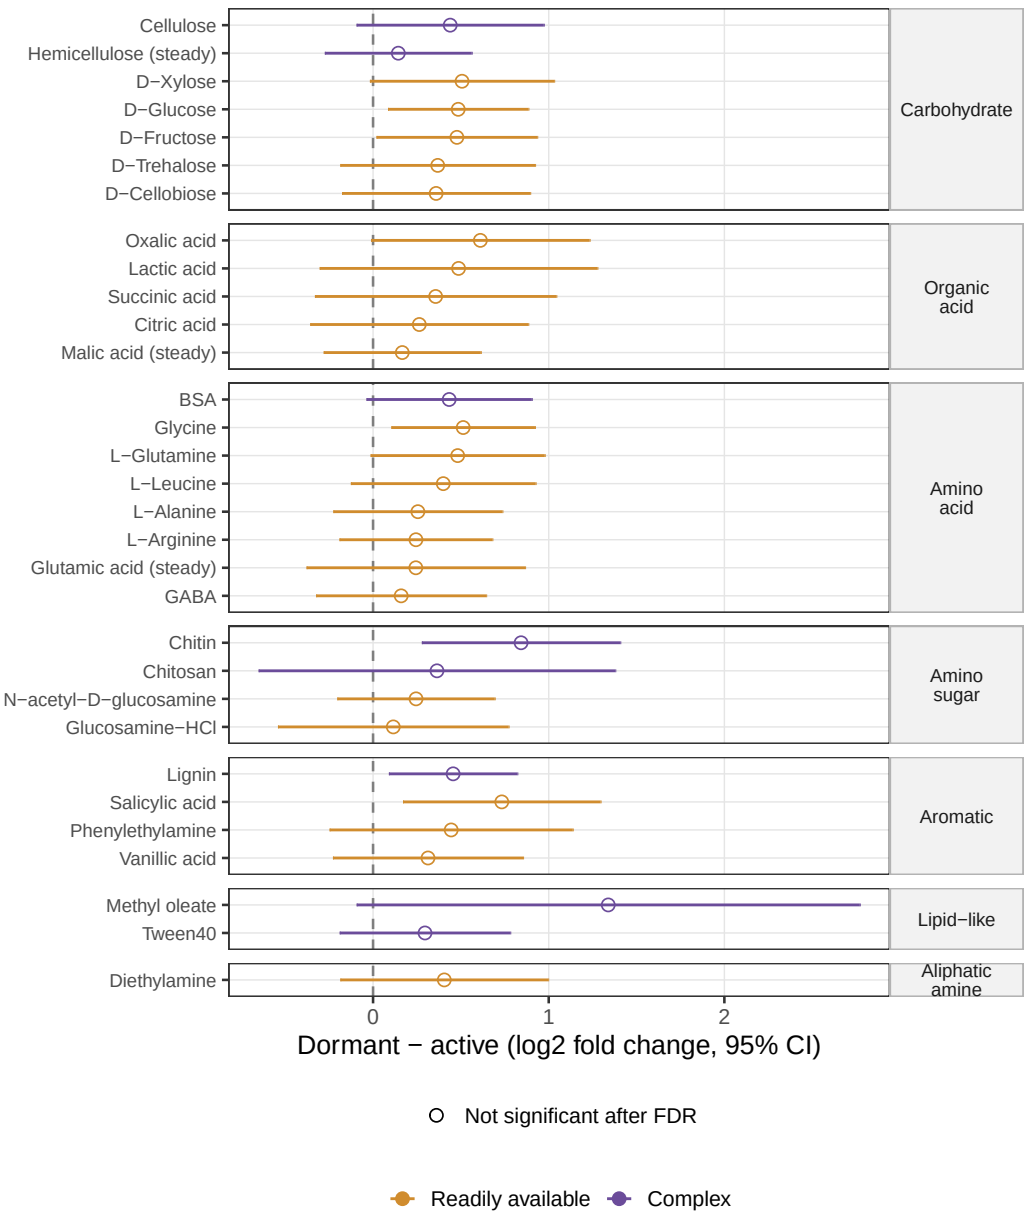
Small points: samples; large: date means. Season tests with dates as replicates: whole profile R^2 = 0.17, p = 0.112; mix only R^2 = 0.04, p = 0.667



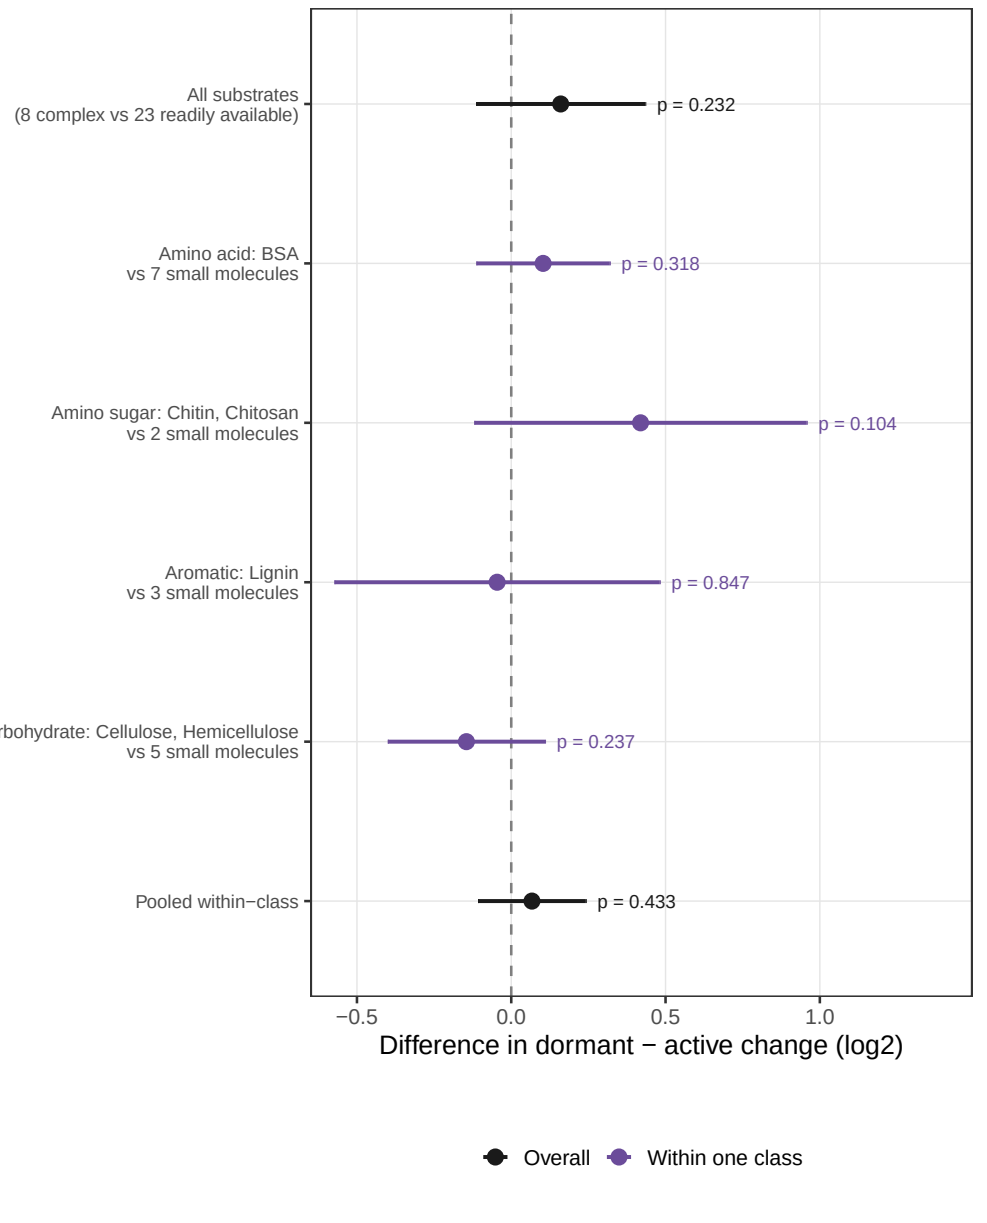
C

Seasonal difference for each substrate

Right of 0 = higher in dormancy; +1 = twice as high



D

H1b: did complex substrates gain more?


Extra dormancy increase of complex over readily available substrates (right of 0 supports H1b)
